

# python environment variable

```
db_url = os.getenv("DATABASE_URL")
api_key = os.getenv("API_KEY")
debug = os.getenv("DEBUG", "false").lower() == "true"
```

So first thing first

we create the `.env` file and input anything credential. then create the `environment_variable.py` (irrespective of the name)

And within the `environment_variable.py`

```
import os
from dotenv import find_dotenv, load_dotenv

dotenv_path = find_dotenv()
#this find the .env file

# load up the entries as environment variable
load_dotenv(dotenv_path)

API_KEY = os.getenv('API_KEY')
PASSWORD = os.getenv('API_KEY')
```

At the end of the day, don't forget to list the `.env` in the `.gitignore` file
